feat.platform_update: FEAT-ZD-48600 (DES-01 check record)

Step DES-01 Platform Architecture Update, attempt 1, run in **check mode**. The step's condition was not met in this run ("condition not met: TRD flags a platform-level change", record:intake). This record shows what was checked, the evidence, the conclusion, and what would make a platform architecture update necessary. No architecture document, code, configuration, test or environment was changed.

Field	Value	Source
Trace ID	FEAT-ZD-48600 (ZD-48600, "Show which overdue invoices belong to vendors that usually pay late")	record:brief; feat.trd
Workbook action	If the feature needs a platform-level architectural change, update the platform architecture document first	record:brief
Owner / gate	Architect / automated checks, independent judge, sampled human evaluation	record:brief
Inputs	feat.trd (approved TRD, commit 3637e51); org.architecture (feature override, commit 3b03f15)	record:brief
Other files read	`org/org.architecture.md` (base platform document); `org/org.decision_log.md`	file:hobasa-agentic-sdlc/org/org.architecture.md; file:hobasa-agentic-sdlc/org/org.decision_log.md

1. What was checked

A platform-level change is one that alters something the platform architecture document states as a rule or structure. For each statement in org.architecture (and the base `org/org.architecture.md`), the check asked whether feat.trd changes it.

#	Platform statement	Source of the statement	What feat.trd does	Platform change?	Evidence
P-1	Four repositories in one flow: ap_pipeline → ap_forecast → ap_aging → ap_portal	org.architecture	Changes code in the same four repositories only; adds no new repository, service or component outside them (C-1 to C-10)	No	feat.trd (header "Repositories"; section 1)
P-2	Runtimes: three repositories on Python 3.9; ap_portal on Node.js 22 CommonJS	org.architecture	Keeps the runtimes; requires new Python code to avoid syntax newer than 3.9 (F-15)	No	feat.trd (F-15)

#	Platform statement	Source of the statement	What feat.trd does	Platform change?	Evidence
P-3	"Keep every existing signature; add new functions."	org.architecture	Only two existing functions change, both additively: `to_model` behaviour (signature unchanged) and `build_explanation_request` gains `risk=None` as the last parameter. Everything else is new functions. The TRD's own validation row records this as Pass	No (rule respected)	feat.trd (IF-1, IF-4.1, section 9)
P-4	Existing function signatures and return shapes must not change	file:hobasa-agentic-sdlc/org/org.architecture.md	`to_model` still returns `(records, rejected)`; records gain one key, `paid_date`, and existing keys and values are unchanged. `aging_buckets`, `days_past_due` and `bucket_for` are unchanged (IF-5.8, T-11)	No	feat.trd (IF-1.6, IF-5.8, T-11)
P-5	JSON between services carries amounts as two-decimal strings and dates as ISO strings	org.architecture	New contract CT-1 (ap_aging → ap_portal) sends `amount` as a two-decimal string and has no date field; any later date must be an ISO string	No (CT-1 applies the existing rule)	feat.trd (IF-6)
P-6	ap_aging: pure library; no database, no network, no secrets	file:hobasa-agentic-sdlc/org/org.architecture.md	`overdue_with_risk` is a pure function; the serialiser `overdue_rows_to_json` returns a string. The TRD adds no storage, schema migration or new persistent data	No	feat.trd (IF-5.8, C-7, section 3 "Data rules")
P-7	Tenancy, authentication, finance posting, payment execution	record:brief (guardrail: stop when tenancy or security impact is unclear)	Explicitly not affected; tier T2	No	feat.trd (section 1 "Not affected"; S-1)
P-8	LLM provider and model (`acme-llm`, `acme-text-2` from `models.json`)	feat.trd (F-7)	Provider, model and `max_tokens` unchanged; `vendor_risk` uses no LLM	No	feat.trd (IF-3.2, IF-4.4, S-3)
P-9	Decisions D-2026-031, D-2026-044, D-2026-050	file:hobasa-agentic-sdlc/org/org.decision_log.md; record:memory	New code follows all three (calendar days, Decimal/string money, paid excluded)	No	feat.trd (section 9)

2. Findings that are near the platform level, and why they do not trigger the action now

#	Finding	Why it is not a platform update in this step	Source
N-1	No transport or service layer between ap_aging and ap_portal exists in the code read; who owns serialisation and transport is open (TQ-3, R-7).	The TRD's proposal (C-7) keeps serialisation inside ap_aging as a pure function and introduces no new transport. The platform statement "ap_portal renders HTML from JSON" already covers this. If the Architect's answer to TQ-3 introduces a new service, API or transport, that **would** be a platform change (trigger X-1).	feat.trd (IF-6, C-7, R-7, TQ-3); org.architecture
N-2	`overdue_with_risk` needs a `vendor` key on each invoice, while the base document describes ap_aging invoices as dicts with `id`, `due_date`, `amount`, `paid`.	The requirement belongs to a new function only; the existing invoice shape used by `aging_buckets` is unchanged. ap_pipeline records already carry `vendor`. The record shape is the data model's concern (DES-02 reads org.data_model), not a platform rule.	feat.trd (F-11, IF-5.7); file:hobasa-agentic-sdlc/org/org.architecture.md
N-3	The platform document names only existing public functions; new public functions (`delays_by_vendor`, `vendor_risk`, `overdue_with_risk`, `overdue_rows_to_json`, `renderOverdueRisk`) will exist.	The platform rule is "add new functions"; adding them is the expected pattern, not a change to the architecture. Listing them is the design document's job (DES-02). Non-blocking question OQ-1 asks whether the Architect wants the function lists in org.architecture refreshed after release.	org.architecture; feat.trd (section 1)
N-4	Existing code conflicts: `bucket_for(30)` returns `"31-60"` (TQ-1) and `formatAmount` formats through a float (TQ-2).	Both are left unchanged by this feature and raised as separate decisions. Neither changes a platform rule; fixing either is a separate item.	feat.trd (F-10, F-12, TQ-1, TQ-2)
N-5	The risk label is added to the prompt sent to the external LLM provider (S-5, TQ-8).	Same provider, model and data path as today; only the prompt content grows. It is a data-flow approval question for the Architect, not a structural change. If the answer is "not acceptable" and the provider path must change, trigger X-4 applies.	feat.trd (S-5, TQ-8, IF-4.4)

3. Conclusion

No platform architecture update is needed now. feat.trd keeps the four-repository flow, the runtimes, every existing signature and return shape, the JSON money/date rule, ap_aging's no-database/no-network property, the LLM provider, and tenancy and security unchanged (P-1 to P-9). All changes are additive functions and one new feature-level contract (CT-1) that applies the existing JSON rule. This agrees with the spine's condition result (record:intake). The org.architecture document stays as it is; the feature design continues in DES-02.

4. What would trigger the action

DES-01 should be re-run in full (the platform architecture document updated before design continues) if any of these happens:

#	Trigger	Linked item
X-1	The answer to TQ-3 introduces a new service, API endpoint, message transport or other layer between ap_aging and ap_portal	feat.trd (TQ-3, R-7)
X-2	Any existing public signature or return shape has to change (for example a fix to `bucket_for` that changes aging totals, or a change to `formatAmount`)	feat.trd (TQ-1, TQ-2); org.architecture
X-3	Persistent storage, a database, network access or secrets are added to any of the four repositories	file:hobasa-agentic-sdlc/org/org.architecture.md; feat.trd (section 3)
X-4	The LLM provider, model or the external data path changes (for example as an outcome of TQ-8 or PROV-ACME-2026-11, PQ-5)	feat.trd (S-5, TQ-8, R-3)
X-5	Tenancy, authentication, finance posting or payment execution becomes part of the scope	feat.trd (S-1)
X-6	A new repository or runtime is added, or the JSON-between-services rule (two-decimal string amounts, ISO dates) has to change	org.architecture

5. Open questions (non-blocking)

ID	Question
OQ-1	Should org.architecture's function lists be refreshed to name the new public functions once FEAT-ZD-48600 is released (N-3)? This is documentation upkeep, not an architectural change.
OQ-2	Two platform documents exist with different scope: the feature override (four repositories) and the base `org/org.architecture.md` (ap_aging only). Should the base document be widened to the four-repository flow so later items do not depend on a feature override?

TRD questions TQ-1 to TQ-11 stay open with the Architect as raised in feat.trd; this check does not answer them.
